

Prostate Surgery at Chestnut Hill Hospital

When medication and other non-surgical treatments are unavailable or cannot relieve symptoms, surgery is recommended for many conditions that affect the male reproductive organs and urinary tract. These conditions may include prostate cancer, ureteropelvic junction (UPJ) obstruction, bladder and kidney cancer, as well as other conditions.

Minimally invasive laparoscopic and robotic-assisted

surgery is the preferred treatment for prostatectomy and other urologic procedures. Chestnut Hill's *da Vinci*® Si™ Surgical System enables surgeons to operate with precision and control using only a few small incisions, ideal for urologic surgery.

Advantages of robotic-assisted surgery:

- Smaller (dime-sized) incisions
- Shorter hospital stay
- Faster recovery

For more information on minimally invasive surgical procedures at Chestnut Hill Hospital visit us at chestnuthillhealth.com and click on Institute for Minimally Invasive Surgery.
